

MOBILE DESIGN PROPOSAL

Field App for Support Workers

An interactive prototype and design direction for the MentorOS mobile app — built from your real platform and benchmarked against the market.

Prepared for **Australian Mentoring Services** · June 2026 · Includes a live, clickable walkthrough

Why a mobile app, and why now

MentorOS is already a complete NDIS management platform. It runs beautifully as a web dashboard for the office — but the people doing the actual work, your **support workers in the field**, have no dedicated mobile tool.

Your own dashboard makes the gap clear: shift-report completion currently sits at **0%** (“no shift report in 7 days”). Yet almost everything downstream depends on that shift data:

- AI participant briefings & behaviour patterns are generated *from shift reports*
- NDIS claim evidence and compliance records rely on documented service delivery
- Care-plan suggestions build as shifts are logged

The app's single mission: make it effortless for support workers to capture shifts, notes and incidents from the field — which switches the entire platform on. It isn't “just an app”; it's the fuel that powers MentorOS.

Who it's for

Primary user: **support workers / mentors** on shift, often one-handed, in homes or cars, sometimes with poor signal. Every design decision serves speed, calm, trust and offline reliability.

The screens (interactive prototype)

A complete, clickable prototype in the real MentorOS brand. Bottom navigation keeps it to four tabs: **Today** · **People** · **Reports** · **More**. Below are the key screens.

Sign in
Secure login + Face ID

Today (home)
Day at a glance + GPS clock-in

Active shift
Live timer, quick capture, AI

Shift report ★
Voice → AI writes the draft

Signature
Proof of service

Participant profile
Risk, health, meds, goals

Incident (7-step)
Your real reporting wizard

Medication
From the care plan

Reports

Drafts, submitted, incidents

More

Availability, timesheets, chat...

A support worker's shift, end to end

- 1** **Sign in** with Face ID — fast and secure for the field.
- 2** **Today** shows the day's shifts; the next one is pinned. Tap **Clock in** — verified by GPS.
- 3** **Active shift** runs a live timer. One-tap capture for note, photo, meds, expense, mileage or incident — plus an AI assistant: **tap to talk** and it writes as you work.
- 4** **Clock out** → **Shift report**. Speak and AI drafts the full report. Supports & medications are pre-listed from the plan — the worker just confirms. AI auto-flags anything that looks like an incident.
- 5** **Signature** — participant or guardian signs to confirm the service (NDIS proof).
- 6** **Submitted & synced**. The participant profile, AI briefings and claim evidence all update automatically — even if it was saved offline.

Privacy by design: the AI is **tap-to-talk**, never always-listening — essential in a participant's home. Everything works offline and syncs when back online; the app locks behind biometrics.

What's from MentorOS vs what we're adding

Nothing here is invented. Every screen maps to real MentorOS data; we add the field experience on top.

FROM MENTOROS — ALREADY EXISTS	WHAT WE'RE SUGGESTING — NEW FOR MOBILE
Shifts & roster (Rostering & Service)	GPS-verified clock in/out + live timer
Participant profiles — health, medications, safety plan, goals, NDIS plan	Risk-first mobile layout; medications pulled into the report
Shift Report Register fields (supports, observations, meds, goal progress, handover)	Voice → AI writes the full draft; supports pre-listed to confirm
7-step incident wizard	Mobile-optimised steps + voice + AI incident detection
Timesheets, payroll, expenses, site chat, compliance	One mobile “More” tab; push reminders before certs expire
AI briefings & care-plan suggestions	Offline-first capture that finally feeds them reliably

How we compare to ShiftCare

ShiftCare is the strongest competitor. The strategy: **match** what's now expected, and **beat** it where it matters.

✓ Matched (table stakes)

- GPS clock in / out
- Voice-to-text notes
- Care plans & client details
- Digital signatures
- Expenses & mileage
- Availability & timesheets
- NDIS-aligned records

★ Where we beat it

- **AI writes the full report** draft — not just a transcription/summary
- **AI auto-detects incidents** from what you say (compliance safety net)
- **Calmer, premium** interface — less clutter, faster
- Each field shows **where its data comes from**
- **MentorOS-native** — one connected platform, not a bolt-on add-on

ShiftCare's app is capable but generic. Our edge is a **premium, AI-first experience built directly into MentorOS** — so the data flows straight back into claiming, compliance and care planning.

What comes next

This proposal covers the core field app. Further modules build on the same foundation.

Phase 1 — Core field app (this proposal)

Sign in, Today & shifts, AI shift report, participant profiles, incidents, signatures, quick capture. The pieces that close the capture gap.

Phase 2 — Intelligence & reliability

Deeper AI (auto follow-ups, summaries, suggested care-plan updates), a full offline sync engine, and smart push notifications (new shift, cert expiry, handover).

Phase 3 — Wider ecosystem

A read-only **family / guardian app** for updates, richer team messaging & handover, and a training / certifications module.

Throughout — quality

WCAG AA accessibility, dark mode, biometric security, and performance — non-negotiables for this sector.

Where to from here

- **Explore the live prototype** — open the shared link and tap through the app + guided walkthrough.
- **Confirm the shift-report fields** with your NDIS / compliance lead so the data matches your audit requirements exactly.
- **Sign off the design direction** — then we move to build.
- **Recommended build:** Flutter for one premium codebase across iOS & Android, with offline-first sync into MentorOS.

In one line: a premium, AI-first mobile app that makes capturing shifts effortless — closing the 0% gap and powering everything MentorOS already does.

Thank you. We'd love to walk you through the prototype live.
